

NACT 245 – Cement Manufacturing

NACT 245 – Cement Manufacturing

History

- Assyrians and Babylonians used clay
- Egyptians used lime and gypsum
- Greeks used natural cement
- Romans used slaked lime, pozzolana (volcanic ash)
- Joseph Aspdin, Leeds UK, developed Portland Cement

Portland Cement

- A fine powder, gray or white in color, that consists of a mixture of hydraulic cement materials comprising primarily of calcium silicates, aluminates and aluminoferrites.

How is Cement Made?

- Limestone
- Clay
- Sand
- Iron-containing materials

Calciner Towers

- Dry pulverized material is preheated and partially calcined before entering the rotary kiln

NACT 245 – Cement Manufacturing

Types of Cement Kilns

- Long Wet Kilns
- Semi-dry Kilns
- Long Dry Kilns
- Kilns with a Preheater
- Kilns with a Precliner

Greenhouse Gas CO₂

- 1997 Approximately 100 million tons of CO₂ emissions from cement kilns

Types of Calciner Towers

- ILC-E In-Line Calciner Using Excess Air
- Single string cyclone preheater kiln with a small precalciner built into the kiln riser duct.
- Combustion air for the precalciner is drawn through the kiln

Types of Calciner Towers

- ILC™: In-Line Calciner
- Single-string or double-string cyclone pre-heated kiln with precalciner built into the kiln riser duct. Combustion air for the precalciner is drawn through a separate tertiary air duct between the cooler and the calciner.

Types of Calciner Towers

- SLC-D: Separate-Line Calciner-Downdraft
- Single-string or double-string cyclone preheater kiln with a combustion chamber/precalciner placed parallel to the riser duct.

Types of Calciner Towers

- SLC- Separate-Line Calciner
- Double-string or triple-string cyclone preheater kiln with a precalciner placed parallel to the kiln riser duct

Types of Calciner Towers

- SLC-I™: Separate-Line Calciner with In-Line Calciner
- Double string cyclone preheater kiln with a precalciner placed both within the kiln riser duct and parallel with the kiln riser duct

Types of Calciner Towers

- SLC-D-NO_xTM: Separate-Line Calciner-Downdraft Low NO_x Type
- Single-string or double-string cyclone preheater kiln with a downdraft combustion chamber and an in-line calciner built into the kiln riser duct.

Other Classes of Cement

- Clays
- Common Limes
- Hydraulic Limes
- Natural Cements
- Pozzolana Cements

Characteristics of Clays

- Chiefly aluminum silicate
- Can be used alone or with other substances
- Formed by disintegration of minerals
- Requires no preliminary processing
- Do not harden in water

Characteristics of Common Limes

- Do not set under water
- Require processing
- Must be heated before water is added
- Produced from calcium carbonate, CaCO_3

Characteristics of Hydraulic Limes

- An hydraulic hydrated lime is the hydrated, dry cementitious product obtained by calcining a limestone containing silica and alumina to a temperature short of incipient fusion, so as to form sufficient free lime (CaO) to permit hydration.....

Natural Cements

- Hydraulic cementitious materials
- Each raw materials contains compounds of silicon, aluminum, and calcium
- Preparation includes crushing and grinding material into smaller size
- Main use is for concrete

NACT 245 – Cement Manufacturing

Pozzolana Cements

- Originally produced by the Romans
- Hydrated lime and finely ground volcanic materials containing aluminum, silicon, sodium, and potassium
- Named for a town in Italy, Pozzolana
- Requires two raw material components: Calcinate limestone and finely ground Pozzolana

Raw Materials

- Calcium
- Silicon
- Aluminum
- Iron
 - ◆ except white Portland cement

NACT 245 – Cement Manufacturing

Raw Materials

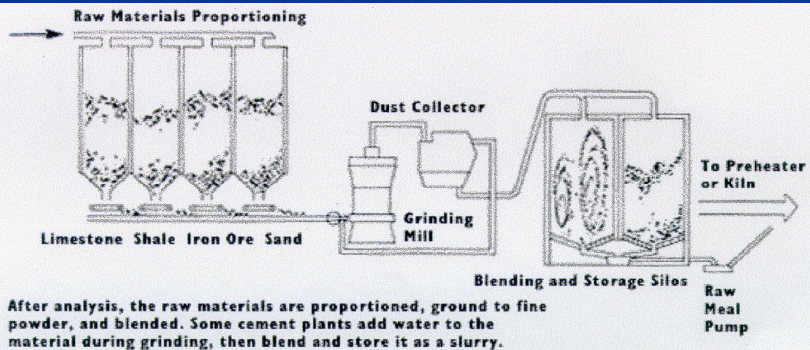

Raw Material Process

NACT 245 – Cement Manufacturing

Raw Material Proportioning

Clinker Process

Raw Materials

- Sand
- Bauxites
- Alumina-rich flint clays

Raw Materials for Lime

- Aragonite
- Calcite
- Limestone
- Marl
- Shale

Raw Materials for Iron

- Blast furnace flu dust
- Clay
- Iron ore
- Mill scale
- Shale

Raw Materials for Silica

- SiO₂
- Calcium silicate
- Clay
- Marl
- Sand
- Shale

Raw Materials for Alumina

- Al_2O_3
- Aluminum ore refuse
- Clay
- Fly ash (also high in carbon)
 - Mercury content restricted
- Shale

Raw Materials for Gypsum

- $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$
- Anhydrite
- Calcium sulfate
- Gypsum

Raw Materials for Magnesia

- MgO
- Cement rock
- Limestone
- Slag

Major Components of Portland Cement Clinker

- Tricalcium silicate
- Dicalcium silicate
- Tricalcium aluminate
- Tetracalcium aluminoferrite

NACT 245 – Cement Manufacturing

Factors to be Considered

- Composition
- Uniformity
- Physical Characteristics
- Manual page 200-9

Factors (Continued)

- Overburden
- Quantity
- Location, Topography, and Transportation Methods

NACT 245 – Cement Manufacturing

Types of Portland Cement

- Type I – normal, general purpose
- Type IA – normal, air entraining
- Type II – moderate sulfate resistant
- Type IIA – moderate heat of hydration and moderate sulfate resisting and air entrained.
Low alkaline

Types of Portland Cement

- Type III – high early strength
- Type IIIA – high early strength and air entraining
- Type IV – low heat of hydration
- Type V – high sulfate resistance

NACT 245 – Cement Manufacturing

Focus

- Processes and equipment
- Regulation requirements
- Inspection procedures

Four Step Process

- Acquisition of raw material
- Preparation of the raw materials for pyro-processing
- Pyro-processing of the raw material to form Portland cement clinker
- Grinding of the clinker to Portland cement

NACT 245 – Cement Manufacturing

Layout

- Quarry
- Preliminary Grinding and Mixing
- Kilning and Clinkering
- Finish and Fine Grinding
- Storing, Packaging, and Shipping

Inspector's View

- Is the facility operating within it's PTO?
- Have all the emission points been identified?
- What is 40 CFR 266?
- Air Regulations – HAP, PM, SO₂ & NO_x emissions, CO₂/GHG
- Are all possible mitigation measures being implemented?

NACT 245 – Cement Manufacturing

Quarry

**Secondary
Crusher**

NACT 245 – Cement Manufacturing

NACT 245 – Cement Manufacturing

Radial Stacker

Pyro-processing

- Dry Process
- Dry Process w/Preheater
- Precalciner
- Semi-dry Process

NACT 245 – Cement Manufacturing

NACT 245 – Cement Manufacturing

Kiln

- Chamber of combustion
- Flue for gases and vapors
- Conveyor
- Heat exchanger and dryer
- Calciner
- Mixer
- Transformer

NACT 245 – Cement Manufacturing

Kiln

Wet Process

- Wet slurry
- 40 – 50% Water
- More energy required to remove water

NACT 245 – Cement Manufacturing

Dry Process

Zones and Temperatures

- | | |
|---------------------------------|---------------|
| ■ Drying/Preheating | 60-1,480 °F |
| ■ Calcining | 1,480-2,192°F |
| ■ Upper-transition | 2,192-2,552°F |
| ■ Sintering | 2,552-2,750°F |
| ■ Cooling
(lower transition) | 2,750-2,350°F |

**Raw
Material
Storage**

The Problem

The Case for Waste

- **Cement manufacturing is energy intensive**
- **Requires between 3 and 6 million BTUs per ton**
- **Requires fuels with high “heat value”**
- **Waste material can provide enough heat**

Tire Derived Fuel

- **One pound of tires has a heat value of 1.5 pounds of sub-bituminous coal**
- **Average tire has 15000 BTU per pound compared to approx 10,000 per pound of coal**

NACT 245 – Cement Manufacturing

Advantages of Waste Fuels

- Utilizes the energy value of the waste as fuel which would otherwise be lost
- It contributes to the public good by keeping these recyclable materials from being buried in landfills, incinerated or injected into underground wells
- It reduces the need for fossil fuels
- It reduces stack emissions by replacing coal with cleaner burning waste fuels
- It reduces operating costs

The Case Against Waste

- Potential Emissions Increases
- Emissions During SS&M
- Downwind Impacts
- Residues in Cement and Concrete
- May Trigger
 - RCRA
 - Haz Waste Combustor MACT (40CFR63 Subpart EEE)
 - CISWI Rules (40CFR60 Subparts CCCC and DDDD)

NACT 245 – Cement Manufacturing

Hazardous Wastes

- Subject to RCRA and 40 CFR 63 Subpart EEE
- Organic
 - Prove 99.99% DRE
- Inorganic
 - Specific limits

USEPA HAP Metals

- | | |
|---------------|----------|
| ■ Antimony | Cobalt |
| ■ Arsenic** | Lead** |
| ■ Barium | Mercury* |
| ■ Beryllium** | Nickel |
| ■ Cadmium** | Selenium |
| ■ Chromium** | |

*Subpart EEE and LLL

**Subpart EEE only

NACT 245 – Cement Manufacturing

What they can not burn

- **PCBs**
- **Pesticides**
- **Radioactive wastes**
- **Dioxins Are Subject to 99.9999% DRE**

Emissions

- **Particulate Matter**
- **Volatile Organic Compounds**

NACT 245 – Cement Manufacturing

Fugitive Dust

Emissions

- Oxides of Nitrogen
- Oxides of Sulfur
- Carbon Monoxide

Emissions

- **Incomplete combustion**
- **Flame configuration**
- **Raw materials**
- **Types of fuels**

Mercury

- **Coal burning median mercury concentration in US coals 0.03-0.24 ppm by weight**
- **21 or 55 lb/MM ton clinker**
- **Human health concerns**

HCl and Dioxins

- Feed impurities and chlorinated solvent waste fuels
- Human health concerns

What Kind of Control?

- Electrostatic Precipitators
 - ◆ Older technology
- Baghouses
 - ◆ Better for very fine PM

NACT 245 – Cement Manufacturing

NACT 245 – Cement Manufacturing

NACT 245 – Cement Manufacturing

Cement Kiln Dust (CKD)

- CKD is alkaline
- May contain organic contaminants

Legal Requirements

- States and Locals
 - ◆ Authority to construct
 - ◆ Permit to Operate
 - ◆ NO_x RACT, PSD, NNSR
- U.S. Environmental Protection Agency
 - ◆ Resources Conservation and Recovery Act
 - ◆ Maximum Achievable Control Technology
 - ◆ New Source Performance Standard

NACT 245 – Cement Manufacturing

State/Local Level

- **Authority to construct**
- **Permit to Operate**
- **Permit Conditions**
- **New Source Performance Standards**
- **MACT**
- **Title V**

NO_x

- **1993 US EPA stated cement kilns are a stationary source that emit more than 25 tpy NO_x, triggered NO_x RACT**
- **Recommended low NO_x burners to facilitate staged combustion**
- **Estimated 25% NO_x reduction**
- **NSPS limit June 2008 (NO_x & SO₂)**

NACT 245 – Cement Manufacturing

Maximum Achievable Control Technology

- **Portland Cement MACT**
- **Three year compliance schedule on controls of dioxins and particulates**
- **Dioxin testing required every 2.5 years**
- **Particulate testing every 5 years**
- **Retesting for dioxins within 90 days of a significant change in raw materials or fuels**
- **Written operations and maintenance plan for kiln and all APCD systems**
- **Encouraging of particulate matter CEMs**
- **HCl and mercury added later**

40 CFR 63 Subpart LLL

- **Original Final rule 6/14/99, remanded in 2000, Newer final in 2006. Major revisions in 2010.**
- **Reduced emissions of air toxics such as arsenic, cadmium, lead, benzene, toluene, dioxin and furans, hexane, and formaldehyde.**
- **Reduced emissions from toxics approx 31% (90 TPY)**
- **Reduce emissions of PM 5200 TPY**
- **Reduce hydrocarbons by 220 TPY**

NACT 245 – Cement Manufacturing

Subpart LLL(continued)

- New test methods for measuring emissions
- CEMs required for PM
 - EPA later eliminated this requirement
- Monitoring, record keeping, and reporting requirements.

Resource Conservation and Recovery Act

- Generation
- Transport
- Recycling
- Treatment
- Storage
- Disposal

NACT 245 – Cement Manufacturing

Old RCRA Exemptions

- “Recycled”
- Chemical wastes
- Exemptions went away with RCRA BIF rules in 1991

40 CFR 63 Subpart EEE

- Hazardous Waste Combustors MACT
- Original Final Rule 1998
 - Revised about a dozen times 1999-2008
 - Transition from RCRA
 - Some portions of RCRA continue to apply
- PM, HCl, Cl₂, Dioxins/Furans, mercury, cadmium, lead, arsenic, beryllium, chromium, CO and THC.

Regulations

- Will the cement kilns already burning hazardous wastes have to comply with the adopted regulations?
- Yes!

Monitoring and Control Systems

- Maximum amount of hazardous waste fuel
- Max. amount of metals from both raw materials and fuels
- Max. amount of chlorine from raw materials and fuels
- Max. stack flow or production rate

How Often Do You Need to Monitor?

- **Metals**
- **Chlorine**
- **Carbon Monoxide**
- **Total Hydrocarbons**

Upsets

- **Partial Blockage of the Kiln**
- **Fuel Interruptions and/or Power Failures**
- **Baghouse or ESP Breakdowns**

NACT 245 – Cement Manufacturing

US EPA Levels of Inspection

- **Level 1 - Unannounced, drive-by.**
- **Level 2 - Serve to gather compliance data, identify violations.**
- **Level 3 - Focuses on a specific problem.**
- **Level 4 - Baseline data gathering.**

40CFR part 60

- **Continuous Emission Monitors**
- **Opacity**
- **NO_x**
- **SO_x**

NACT 245 – Cement Manufacturing

Six Points of Inspection

- Capture
- Transport
- Air Mover
- Instrumentation
- Subsystem
- Control Device

Capture

NACT 245 – Cement Manufacturing

**ESP
Breakdown**

Malfunction

NACT 245 – Cement Manufacturing

Transport

Where would the emission points be?

- Baghouse stack
- Transfer points
- Material buildup
- Dust piles
- Housekeeping
